#### 4.7.1 Detailed Description

Filter realizations based on Robert Bristol-Johnson formulae:

http://www.musicdsp.org/files/Audio-EQ-Cookbook.txt

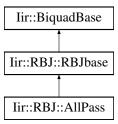

These are all 2nd order filters which are tuned with the Q (or Quality factor). The Q factor causes a resonance at the cutoff frequency. The higher the Q factor the higher the responance. If 0.5 < Q < 1/sqrt(2) then there is no resonance peak. Above 1/sqrt(2) the peak becomes more and more pronounced. For bandpass and stopband the Q factor is replaced by the width of the filter. The higher Q the more narrow the bandwidth of the notch or bandpass.
